

GRIGORY GRABOVOY  
Lectures for primary level lecturers  
**A method of managing by focusing  
on numbers or creating numerical series**  
(1)

In today's lecture  
according to my system of Salvation and harmonious development  
I show the material from the first lecture  
from the course of the next four lectures after the introductory  
and the technology will be like a lecture  
that first I give the management methodology  
by concentrating on numbers  
or creating digital series

and I show a specific practical example  
how to apply based on my personal practice for example  
I show the universality system  
in the transition from the practice described, for example  
there in the three-volume work "Practice of Management Path of  
Salvation"  
for some general situations

and after the first part of this lecture there will be the next part  
when will it be possible to write out specific questions  
and I will be conducting discussions on these issues  
the next part of the lecture  
she will be after the break

and that means the technology will be like this  
what does it mean can means in the second part  
or specific questions  
well, for example, related to the material of today's lecture  
so let's say exactly half of the first lecture

or you can write out the questions  
which relate to, as it were, all of the preceding material

i.e., in principle, it is better to divide the questions into two parts  
this is the first part that concerns today's lecture

the second part is what concerns, for example, all the material

and preferably in the third part, well, for example, in the form of questions  
or so to speak, variants of some staging systems  
identify specific tasks  
that you are solving or want to solve  
or those systems that, well, for example, from your point of view  
You might want to consider

best of all it should be  
some specific tasks  
some specific things  
which you, for example, are already implementing  
and at the same time you have, well, a desire, for example, to somehow  
discuss it specifically  
this is some option that you want to consider

so now i'm moving on  
it is precisely to the first part of the lecture material that means  
i.e. the second part will be to a greater extent  
precisely as a completely practical part  
work-related  
and with answers to possible questions or suggestions

so in the first part of today's lecture  
I want to show the control system  
means based on the creation of numerical series

i.e. the basis of this management  
will be that in the structure of creation of numerical series  
first level  
this is the level of action, which means the same as the Creator acts

i.e. you need to try from the start  
fundamentally organize the number series  
which means that in principle it should be exactly like this  
which one means  
firstly, it is still quite simple  
to control it

and secondly, he is exactly like that  
which ensures precisely the multifactorial control

i.e. according to the Law, it means connections of any information  
with all the external and internal information there  
region  
here we need to take into account that here is the simplicity of the  
series itself  
must necessarily mean contain  
the principle of well, in fact, such management  
which could be through simple concentrations  
give a fairly general influence

because the more general influence you have  
on the system  
the more accurately and quickly you receive  
or let's say it correctly in time  
get the result of management

in his practice of Salvation  
I am implementing the system of Macrocontrol first  
when you do management of so to speak Macro area

i.e. the area where the information is stored  
obligatory Salvation of all  
for example, from a possible global catastrophe

level of personal Salvation  
and the system of harmonious Eternal development

even in this technology today  
the information transmission system is also being laid down  
those. knowledge transfer  
which you get as a result of managing the numbers there, so to speak  
and in a more general sense  
this is the creation of a number  
and control of numerical series

this means that this type of technology includes  
it means sample  
in the system of your Perception  
namely the areas of Macromanagement  
and then already means the definition of the area of private  
management  
i.e. this is your private task

and in the number system it often happens like this  
what the number itself actually means  
or Macroregion  
or, for example, the area of a private task

or you enter informatively as if you were entering  
the meaning of Macrocontrol in a series of numbers  
Well as if you are saturating the number series

or it means you saturate some numerical series  
namely a private task

so the methodology here is as follows  
to mean to understand the principle of the number  
definitely needs to be considered  
Well, two simple parameters are enough

i.e. the first parameter as I already explained  
this means the number itself  
contains information specifically about Macrocontrol

and therefore the second parameter  
that you, for example, saturate with information Macromanagement  
some sequence of numbers  
as if you were highlighting it in Consciousness  
or concentrate more time  
on this

further, the same applies to private tasks

the scope of private tasks includes concentration on numbers  
as a task for example  
Well let's assume any private this treatment event management  
but it is also possible to put it in the category of private tasks  
and the task again of Macromanagement

i.e. in connection with this  
when concentrating on numbers, be more careful  
It is with this particular control feature  
when does it mean subtask i.e. well as if a sub-region  
This is also the full scope of Macromanagement

because well if we assume to consider  
elementary action  
there is addition  
to get the number 9 you need to add 4 and 5  
there in logical Perception

then in principle if 9 is the area of Macromanagement  
for the given current time  
then in principle we can assume that for an autonomous system  
for example 5 is also the area of Macrocontrol  
if we don't do addition

so be more careful  
in number management there is such an element here  
what does Macroregion mean? This is already an investigative area,  
among other things

and when we consider such a principle of organizing the number  
you see, let's say, a fundamental spectrum  
fundamental principle of organization  
where do you already cover the maximum amount or something systems  
and at the same time you make a support  
on some very simple system  
which generally takes into account all parameters  
which I just mentioned

so from the point of view of information transfer  
since the task of management is also the transmission of information  
so in the future, it's better to give it as a goal right away  
namely the Infinite Transfer of Information  
without distortion

number system  
so it really allows you to do it quite correctly  
and so here it is as I said  
what exactly is the educational level  
as if the level of transmission  
is still embedded in the Macrocontrol system

in some cases be more careful  
precisely during analysis  
considering that Macromanagement  
including the transfer of knowledge

i.e., in principle, systemic Infinite development  
This is of course the level of transfer of knowledge  
which creates such technology

it means that the lecture will be based on a specific level  
that's exactly the technological embodiment, so to speak  
that concentration and control will be given  
or creation of a number series plus practical material

Be sure to consider  
what well this is the practical material that I use  
from his three-volume work "Practice of Management Path of  
Salvation"  
it shows a variant of say control  
for the time of implementation of an already recorded task

when will you use the material  
Well i.e. the completed task  
when you use the material for control  
well, for some other similar ones  
you can even use it  
not necessarily on exactly these aspects of course

i.e. be sure to generalize the material  
and don't correlate it with that particular practice  
which I will show

because the principle means showing this practice  
consists of  
that the fact itself is a certain level

well, like information support for management  
and therefore try here is the principle of creation  
namely universal systems  
control systems  
from the lecture part  
and from the part that will be shown  
from the point of view of the ratio  
with my specific personal practice

it means creating a universal transition level  
how to generalize for yourself  
where each method can be implemented  
in fact, well, in general, in any case

i.e. universal control  
and therefore we must understand very clearly here  
what does it mean it is always desirable to organize  
it is precisely the universalism of the spiritual Perception of the method

I'm starting work now already  
for the transfer of specific methods  
methods in this lecture mean  
i.e. in the first part of today's lecture  
there will be eight  
each of the methods will be considered in this way  
what will be offered exactly means practice  
from the three-volume work "Management Practice Path of Salvation"

and shown as from the point of view of this practice  
this means that such a method can be implemented

here we need to take into account  
that since we are talking about the same thing again  
that this practice has already been implemented  
then according to the processes of future management  
It is absolutely necessary to make a universal systemic transition

so the first method is that  
that you are creating a number series  
by saturation  
as if the area of Macromanagement

i.e. the numbers in this case do not contain the Macroregion  
and you just create a number series  
and saturate with information, for example, Macroregions  
specific numbers there

and therefore also private information by private management  
saturate some other numbers  
i.e. the numbers in this case do not contain  
the control area itself, in fact

so two actions are required here  
this is the creation of number series

and the second act  
it's still a concentration  
on these numerical series  
with the aim of giving in its Perception  
as if the maximum of the expanded optical coefficient  
when you see the glow of rows in your Perception

for this, in order to manage  
In principle, it is necessary to represent these rows  
or you can write it out for example let's assume on paper  
and at the same time, how to work with paper

i.e. here you can sort of use  
including written rows

in this case, it means that management comes down to this  
as I said that to create a series  
we need to consider the fundamental principle of creating a series  
and this principle is here that  
what if you consider for example the principle of organizing numbers  
then we can say that there is a starting point, so to speak, an organization,  
yes  
of all any Reality

and this is the starting point  
it has, well, like, absolute meaning

and in connection with this  
at this point  
the concept of some kind of "universal level" is introduced  
which must exist in a number or in a numerical series

so in connection with what it means we are dealing with  
Well for example with a specific number  
there are 9 numbers and zero

then in this case  
precisely the principle of organization  
something so universal spaces  
where there are quite universal properties  
in terms of numbers  
it is a number in this case (0) zero

i.e. if we use this number  
as a number of community  
the number means as if it were a universal system

then it is clear that if we, for example,  
Well there we add up a lot of zeros  
we still get zero

i.e. some kind of invariant space  
which basically does not change  
depending on external conditions

and so let's say it this way  
in the zero space of Thinking we will say  
let's call it, for example, "null space"

then within the framework of this null space  
it is precisely the level of transition that occurs  
through the zero system  
to any other system

and in connection with the fact that this is precisely access, for example  
Well, it should be like that in management  
that you should get into any system, generally speaking

then placing any system well any system like that  
so that it is manageable  
we will be able to see the effect  
that it is manageable  
if near zero  
generally arrange any number

i.e. firstly, the number itself remains the number itself, yes  
i.e. we find the point of stability  
there zero plus one is one, etc.

and we can also arrange  
generally speaking from any side

i.e. if we consider that in the collective Consciousness  
there is some kind of control logic

related to the placement of numbers there, etc.

then zero is just a universal number  
which is located  
either right or left  
while not changing the characteristics of the adjacent number

therefore we believe  
that according to the Laws, it is precisely creation  
absolute, as it were, universal system  
we can consider as this system  
number zero (0)

and according to the Laws of the Creator  
precisely according to the Laws of universal connections  
and direct access  
we see the fastest possible access  
to the number for example one 1  
if we take zero 0 there and add 1 to one

we get a number in principle  
one 1  
but very quickly

this is precisely the principle of speed in Consciousness  
it just characterizes the next level  
in constructing a number series  
in this first method of management  
through number

that the numerical series should be arranged as far as possible  
as if more systematically and more harmoniously  
relative to zero

therefore, arranging the number series in this way

what is a number from one 1 to four 4 for example  
is located vertically upwards  
top down  
i.e. we construct, as it were, two numerical series  
in this administration  
that 1 2 3 4 are those numbers  
which are located from top to bottom, for example, to zero 0

Next come the numbers 5 6 7 and 8

and now we take the nine 9 and mentally  
i.e. we train with this level of will  
we bring out to the center as if zero 0

so we continue building  
from left to right the same system  
where does the intersection go  
i.e. we build the system horizontally  
where the intersection goes again with zero

and if on the left there will be 1 2 3 4  
then accordingly to the right of zero  
it will be 5 6 7 and 8

what we did  
the construction is actually crosswise  
where does it mean that inside is exactly zero 0  
and then we start this system  
Well as if to pull into the sphere of management

i.e. in this case the sphere of management is as follows  
what first of all  
top and left part  
this is so given as if a cross-shaped yes  
arrangement of the number series

This is management related to Macroregulation

and on the right and below  
This is a management of private tasks

as I said in this case  
it is necessary to precisely fix the meaning of the numbers  
which correspond to either Macromanagement  
or managing private tasks

so there is another sub-meaning of this control  
what is in macromanagement  
there is private task management

and vice versa in particular problems  
there is Macro level control

in this case it is done through the number 9  
which is inside zero 0

so you tied the system as if  
Well in other words, you created a certain node  
in management information  
which denotes sustainability  
and in general continuous action

because through the number 9  
you have created a unique combination of control elements  
in general, what does this have to do with it  
which constantly saturates the management goal  
further special task  
is the introduction of a management goal  
i.e. pay attention here  
that the saturation of the control system  
as if at the level of private tasks

example , you have a problem that needs to be solved  
and you have filled this task  
so it is the right and for example the lower level of numbers yes  
right and bottom part  
this cross-shaped connection

then in principle further management by purpose  
it boils down to the fact that you  
saturation in this case  
you can do it spiritually

and then you formulate a specific problem logically  
inside the number 9  
Well as if writing the number 9 on the contour  
management task

and this action takes place inside zero, moreover

this way you get a fairly stable system  
which one well as if hovering  
on the controlling meaning of a kind of event series

if you look at some series  
you can detect in this case  
the most important systems in your events  
and gain control in this way  
that these events will also be further enriched  
for their implementation

therefore, according to the Laws of the Creator  
you are actually creating an Eternal structure  
Eternal construction means it is as if  
Well, universalism and repeatability and sustainability  
in the processes of Eternal development

therefore this is the design  
She works exactly under these conditions

the next level is  
already folding the structure into actually in general  
into a spherical element

but you can fold it for that  
so that well how not to do it  
namely control of the entire system  
you can fold it so that you can actually build a figure eight  
and here is the whole structure that I outlined  
bring it into the lower part of the figure eight

then concentrate only on the eight 8

Means then you will get control through the number 8  
but this number contains quite a lot of levels of control  
which follow exactly in this cross-shaped manner or something level of  
arrangement of the number of numerical series

i.e. in this case we use  
only vertical and horizontal level  
for management

from a practical point of view  
I will show the control  
which in this case may be  
as if additionally told  
from the point of view of specific practice

I had such a protocol 07/92

This is on page 41 of the three-volume book "Management Practice Path of Salvation"

it's in the first volume

and in this protocol

I did diagnostics of airplanes by tail numbers

means that generally speaking only the plane number was given

and in this case, to identify, for example,

well, some kind of defect or, on the contrary, the norm of the aircraft for a certain period of the Macromanagement system

i.e. what I call the Macro Management system

in this case it's the same thing

i.e. this is all the information where there is no possible global catastrophe

but in this case it is implemented in this way

what does it mean from the point of view of, for example, implementation

in relation to this protocol

when will you look at the protocol

look at the specific aircraft numbers

i.e. if for example I see an airplane there

85189 tail number

then the Macrocontrol system consists of

that I kind of just relate

well, a sample of these numbers

i.e. I do it this way

for example, if the number 1 is on top, then it turns out to be on the left too

then I create management

by means of communication

numbers for example 1 which is in this simple number

but generally speaking we use

a fairly limited number of digits  
I just display this number 1 on everything  
in the area that corresponds to one 1  
and at the same time corresponds to, for example, Well purely mechanically

i.e. I take, generally speaking, the aircraft's tail number 85189  
so I tie this number with the unit 1  
which is located above and to the left

in this case the geometric arrangement  
it's like this  
what I take as a whole series

i.e. here it is of great importance  
the location of specific systems after all  
in relation to precisely Perception

that Perception can be  
or as if horizontal or vertical

here the management takes into account  
it is precisely the spatiality of Perception

and the numerical series is considered  
precisely as a geometric system  
i.e. as a whole row

and therefore if we consider this system  
exactly in this way  
then 85189 to the left of one will be 85  
and on the right there will be 89 from above if

and if we look from the left  
then below it will be 85 and above it will be 89

Well i.e. it starts as if it were just on everything as  
as a system of peculiar crystallization  
should we bud off ?  
level of optical perception

and further systems  
on the sustainability of the performance of specific tasks  
what will happen to him with this plane, for example ?  
in the period there in this case was the period from January 17 to  
January 27  
i.e. 10 days

I only track on just levels  
exactly as if the levels of particular tasks  
i.e. to the right and below

and at the same time I can indicate  
for example all the systems of the aircraft in this way  
what for example the bottom row which is located  
Well as if to the right of zero and to the right  
this is the row that corresponds to, for example  
level means the main systems

and the bottom row is like a level  
private some specific well in general there are no problems  
directly related to the units

but let's say I don't need to consider units there  
I can then consider management by main systems  
and consider the principle for example  
only due to the right part of the row  
those. from zero to the right

in this case the level is actually  
it turns out to be quite simple

i.e. you only need to fix it with your Consciousness  
just geometrically this system

it starts to light up on the right  
in your Perception  
some of the numbers <sup>there</sup> from 5 to 8 <sup>for example</sup>

if the number 5 or 6 7 8 is <sup>displayed</sup>  
you just need to distribute it at least <sup>approximately</sup>  
what on the plane corresponds to some number

and then you see how the management goes  
This is <sup>basically</sup> management from a diagnostic point of view  
and at the same time management to prevent a catastrophe from  
happening <sup>there</sup>

and here it is precisely so that it does not happen  
catastrophic level <sup>, so to speak</sup> development of information  
the main concentration must be carried out in the number zero 0

i.e. inside zero where the number 9 exists  
you do the management first  
that there is no plane crash  
then you already do the management  
<sup>as if</sup> moving along a numerical row  
either from zero to the right or down  
and in accordance with the assigned level  
Still, this is a somewhat complicated diagnosis  
you will have to appoint <sup>then</sup>

i.e. <sup>for example</sup> the number 5 say that to the number 5  
several systems apply  
if you hit number 5 then you go down further  
again at such a cross-shaped level  
and you get into a specific system

i.e. well somewhat algorithmic diagnostics  
however, it is actually very simple  
You just have to write down what number corresponds to what  
you can also diagnose any car  
and generally speaking any event

those. it is the universalism of this diagnosis  
consists in the fact that  
that you can write out the date of an event even of future events  
there for example year time number  
and the numerical series can be diagnosed in the same way  
from the point of view of what is in the event  
it needs to be made into a control element

i.e. it is a universal system for not only diagnostics  
but also to create an optimal factor for the development of a series of  
events  
if you focus on nine 9

so the next method is that  
what do you mean you do diagnostics  
by creating so-called well as if  
"creeping" or something so if you can call it that  
number series

so I also use practice, well specifically my own  
to show and summarize how this system works

and that means in any system you try to find  
Well as if the most simple accessible phases by that  
that you can system well as much as you like to simplify  
by transferring there for example on paper

but at the same time you get comparable diagnostics

because you know what's going on <sup>there</sup>  
at the moment <sup>well what about</sup> this diagnostics

it means diagnostics that concern management specifically  
through <sup>well let's say I call the creeping rows</sup>  
i.e. in optics it looks like this  
what do they start from you ? like some paths  
coming from the physical body  
begin <sup>to spread out in the optically revealed range</sup>

here you set the goal of management  
arises from you must arise  
<sup>as if</sup> simultaneously with the development of this numerical series  
<sup>this means that</sup> a certain path will appear  
towards the implementation of the event  
number track

so here's the task  
this is to organize this numerical track  
by management objective

and the principle of organizing the number track  
it's quite simple  
all you need is 1 to 9  
<sup>how to</sup> lay down potential numbers  
that come from you

and as zero 0  
use exactly the restriction  
i.e. zero 0 at the end of this row it is not in front of the row  
the series starts with one 1 <sup>for example</sup>

but as soon as you start fixing zero 0  
and set the path itself <sup>as the</sup> goal of management  
where the top part is Macro control

like, well, you just take it and imagine it  
that there is a certain luminous series  
which lies on the illuminated optics  
for example on some parallelogram yes

and the top layer is Macrocontrol  
and the bottom one is literally half cut off there  
this is your frequent task

so once you start to lay out the numbers  
then fixing zero 0  
fixing zero 0 at the end of this row  
starts to act this way  
that some of the numbers begin to shift as if they were mutually  
and you, by identifying, as it were, numbers  
which begin to move  
you basically start to build a number series  
by management objective  
which is a private goal  
and is located as if under this path

so the principle is very simple  
you need to tune in whenever possible  
there heart rhythm  
or there on the movement of the hand  
i.e. tune in to yourself  
and once you have set your sights on the management goal  
and identified the management goal from your point of view  
that means, let's say, according to the heart rhythm  
can you highlight those numbers  
which from 1 there to 9 you have located on this track  
which are necessary  
or lift it up and, for example, remove it from this path  
or change places as if

here is the principle of this management is that

what are you talking about from the point of view of fundamental systems

you should definitely make the controls like this

so that you can identify the number series

which corresponds to the management of this event

and at the same time they arranged the numbers correctly

here is the principle of revealing numbers

in this case he is the one I said about

and in connection with this

if you, for example, do management

in relation to the event, let's say

well which is located well as close to you in time

then the management here is like this

that you can somehow find numbers, generally speaking

depending on how you see events

for example, even from the point of view of time

for example, very , very simple

for example the principle of this control

is that you do the management

at the expense of just that

that you take for example the date of this event

and this event is sort of isolated from the composition of numbers

Well if this event is on a specific date of the month

then you just use this number of the month in general

take these two numbers and transfer them as if to the base

this is the simplest, somewhat mechanized method

but which is generally related to the concept of "sample"

so from the point of view of management according to this system

I wanted to consider the principle of how it works  
in accordance with that  
how could diagnostics be carried out  
according to the diagram it means just mines

and according to this scheme it was possible to identify at the time  
specific there for example, places where fires occur  
and finding for example there are living people there

in this case, from the point of view of this technology  
you just need to consider the scheme as an event-based problem  
i.e. well, find specific places  
and the diagram is that light path , so to speak  
which in this case is approximated  
with backing and control

and the digital series is a system  
which generally speaking should show the location of the number  
the location of the number at a given level  
and this number must mean something

so first of all if there are two parameters  
there find where the fire started  
and find, for example, living people

that is, you have two parameters  
which you highlight in the number series  
and you say that in this number series, for example,  
do you have well For example like a level  
where you want to implement exactly this information task  
find a fire there

you assign for example the number 2  
we can say that this number corresponds to the fire there  
and the number 1 is the location of the place where people live

then in this management your task is  
just find it on the diagram  
where is the number 1 generally speaking on the diagram  
and where is the number 2  
and you basically go on further do such management  
what does it mean here, after all, the work consists of  
what you need to find is the movement of a number

i.e. you lay out this path in this way  
what in general you will have to do next  
so how to identify the movement of the number 2 and the number 1  
with some point of this scheme

once you figure it out it's there

but here is the meaning  
that you put this path as if on a sheet of paper

and if possible, do it now  
so, as a practice, this action is something like this  
i.e., for your tasks, break down this path, for example  
and find some information  
Well which you may already know  
just go and find this information  
Now  
and I'll just watch

this method , well, it seems, consists of the following  
what if you are looking for information  
should , as it were, reveal the most active system, so to speak  
which you see, well, most of all, illuminated system  
related to number

and therefore it is easy to find that number

which is located at this point  
which you chose for example

it means that now I have spoken as if about principles  
Well or something of the fundamental organization of numbers  
from the point of view of synthesis systems

i.e. in this case I was showing the technology  
where does the spiritual system work, for example?  
i.e. you work at the level of the Spirit of the Soul of Consciousness  
and at the same time we are talking about that  
that your body, i.e. your system , so to speak  
well, realized in the form of a physical body  
when moving there when reacting when developing  
it affects the system I just talked about

the following two methods  
they are designed more for work  
through the logical phase of Consciousness  
and that's exactly it as if the principle of operation  
through the aggregate systems it is like this  
which is not necessarily the case in aggregate systems  
How exactly should I understand the system?  
from the point of view there Well let's say general manifestations

the main thing is to know that, generally speaking, the principle exists  
and implement as much as possible  
well, more on the level  
Well as if even those systems could be possible  
which are more general and not as specific as we would say

i.e. the principle of identifying the number  
the principle of considering the movement of numbers there  
it's like a principle that comes down to work  
in accordance with the level as if  
which is related to external Reality

The following two methods of the method are related to the work where you control the situation at the level of just everything logical phase of Consciousness  
you don't need to consider for example  
fundamental aspect of management  
and it is enough to just know the sequence of numbers, so to speak, which  
so you well this exact sequence  
you consider it to be a control sequence

so to reveal such a sequence  
in management  
we need to consider well It's like a very simple principle or  
something management  
by translating the number into the optical phase of Perception

for this you need to make a sample of numbers  
depending on the control task  
and as if by this number or some specific one  
from a sample or a whole series  
how to bend the sphere of Perception  
to the level of the spheroidal

i.e. the meaning of this control  
that you have to sort of bend the number series  
at the right point of Perception

and then you implement at the same time  
as a task of Macromanagement for Macrosalvation  
and my private task

i.e. here the principle is one of unification  
and here this number is for example there is macro management  
and this number is a private problem

in the first given well as if already in the third method  
but in this case it's like a sub-method  
where the principle of the logical phase of Consciousness is used  
it's the same here  
i.e. what is Macromanagement what is a private task  
in number it will be like everything is merged together

it will be a single system  
which does not distinguish between private management  
and for example Macrocontrol in this method

so this management comes down to this  
what do you take well in this case  
I kind of postulate this method  
i.e. because the principle of postulation  
it just introduces the logical phase right away

i.e. you take the number 4 7 9 and 8 i.e. four numbers  
and arrange these numbers as if in sequence  
from bottom to top  
in the place where it is convenient for you  
better near the physical body  
somewhere around 50 centimeters away from you at most

by arranging these numbers vertically  
so you put it into the number 9  
the principle of precisely target management  
and correlate the number 9  
in relation to these highlighted numbers it means thus  
so that the number 9 is as close as possible  
as if in the space of your Perception  
to the number 4

and further management consists of nothing more than that  
that you kind of mechanically reduce  
this number 4 there like this

Well how do you thread the line through the number 4 <sup>there</sup>  
which pulls <sup>the</sup> rest of the numbers along with it

you just stretch them out  
through the circle of the number 9  
those. through the upper <sup>symbol of</sup> the number 9  
where there is a circle where the structure is <sup>not</sup> broken <sup>or something</sup>

and below where the structure of the number 9 is broken  
you <sup>kind of</sup> mentally add up to 8  
thus you fix the management goal

i.e. you select a number series  
and just <sup>kind of</sup> thread it through the nine  
and the goal of management is obtained  
where Macro level and logical level  
connected <sup>as if</sup> in one task

in this case, according to this principle  
you can find <sup>for example</sup>  
Well I had a specific <sup>practice</sup>  
this is diagnostics, <sup>meaning</sup> answers to solve problems  
page 372 <sup>of the second volume</sup> <sup>then</sup>

and what concerned <sup>specifically</sup> work  
for diagnostics, <sup>for example,</sup> of a mine  
It's better to look at the whole protocol <sup>there</sup>  
i.e. from page 284 to <sup>actually</sup> 286  
i.e. it is better to read the entire protocol during practice  
from the point of view of testing <sup>this</sup> method

and when you look <sup>for example</sup> control by number  
Well the method I mentioned  
then I simply wrote according to protocol 372 here in this case  
pages 372-373

I wrote answers to problems without solving them

in this case the principle is very simple  
the meaning of the task is sort of embedded  
Well as if the parameters of the task are there starting from 4  
sequence of numbers  
and the solution is the action that occurs  
after we enter 4 as if  
together with everything next to it inside there are 9  
and the solution is viewed as 9 on the vertical plane

i.e. here is the meaning of management  
where to get ready where to get goal and management  
the goal of management is to obtain a solution to a problem without  
solving the problem

hence  
we must define the plane in Perception  
means that this control is designated  
and then you should see  
here in the space of Perception behind the number 9

just put it vertically  
as if a dimly luminous plane  
with a faint glow  
and just simply accept the answer

in this case, actually, it does not apply  
again, as I said, to the level that has already been implemented, for  
example  
This was back when I was still studying at university.  
in this case

so this level here is like this  
what is desirable when you do such exercises  
make generalizations about the structure of a future event

and this generalization is that  
that you should highlight the scope of possible solutions , yes

so, i.e. this is the sphere of possible solutions  
here is the point  
that you, well, sort of take and limit the field of work , for example, yours in this  
way in the space of Perception  
what can be for example the plane that is behind this 9  
in the process of your Perception, as if to vary  
Well For example there plus two centimeters there closer yes  
or theoretically even further

those. plus or minus two centimeters there  
i.e. to declare that the plane on which you receive the answer  
exactly plus or minus two centimeters  
then you will get an adaptation of this system  
on the system of future events

i.e. if you have a task like this  
get an answer or get a specific time eg yes  
or a specific control system  
related to number  
then you can get it this way

so considering that in this case  
the method i showed  
relates more to  
as if to the logical phase of control

then here  
Well here is the next method that I also want to show  
it relates to a greater extent again  
to the logical phase of control  
but the difference is that you get control  
Well in fact, as if in this way

what does it mean that control occurs due to that  
that you give the number a kind of dynamics in development  
Well or something of your Thinking  
i.e. the number acquires speed characteristics

then you get access to numbers for example from the point of view  
there let's assume future processes

and here is the creation of speed, let's say, yes, numbers  
this is a control characteristic  
but this is still a more logical phase of management  
than there is a synthesized control system

so considering that from each method that I mentioned  
in general, it is possible to create a more adapted subsystem there  
here we need to well as if for myself personally  
here you need to see that the speed characteristics  
this is also, in general, a logical phase  
it is possible to speed up the development of numbers  
for example, the speed of movement of a number in the space of  
Perception

or relate this movement, for example, to the physical level  
and say that there is exactly such a level  
which is necessary for it to be perceived  
means to solve a specific problem

and as an example I want to give here  
here, well, there will be an example that will apply  
already to specific situations, for example  
associated precisely with the dynamics of the number

then as an example I will immediately tell you about the example  
it will touch a large range of numbers  
the point is that a response was received

the range from  $10^{-6}$  to  $10^6$  degrees  
this is the order of migration

so when I explain this method for example  
compare this with that if possible  
that the method can provide precision in management  
and in access to information

i.e. to set, as it were, precise control characteristics  
even with a large amount of information

and here the situation is that  
that when you for example do this control  
then creating speed or giving speed characteristics to a number  
this action is quite simple , generally speaking  
and it is connected with the fact that you are just  
create  
for a specific number  
so, well, actually the trajectory of movement  
to the desired control point

and the action is like this , for example , you highlight the number 4  
thus, i.e., you work with only one number

for example if we consider the number 4  
Well as if consisting of means for example there are four segments there  
then I start the upper free segment with the number 4  
more well as if from the left side  
This is the area of Macro Management  
everything else means Well arrow to number  
as if perpendicular to the segment  
this is the level of private tasks

so mentally we kind of twist it  
top part of Macro Management

and as if trying to bend down mentally  
Well i.e. change the system in such a way  
what is there where Macrocontrol is, this upper segment  
I try to bend down as if  
really bending over

you set the speed of development of the number  
and the speed can be tracked generally speaking  
in relation to well if for example I could draw  
It's probably better to have this system

so in principle if we take a number, for example, 4  
then we are talking about this part  
where is Macro Management  
we try to bend it down  
in relation to  
Well mentally direct the vector of movement here and down

then we get a certain torque, generally speaking  
in the structure of Perception  
and set the speed characteristics  
which are visible only by the speed of development  
like along this upper level or something  
Well just vertical like this  
like, well in general, it 's actually straight  
although it is visible as a segment  
and all you need is just  
fix at some point  
for example the event number  
and the number of the event you can just  
insert a period here for example  
and denote this with the number 5  
on the axis it's just small, you take it and write it there  
there is mentally the number 5  
you think that at this point you have recorded the event

then this is the threshold level

in 5  
you perceive it as a wave splash

and here is this splash of a wave  
this is the realization of this event  
due to the speed characteristics of the development of numbers

i.e. the number, generally speaking, begins to twist  
and strives for the event  
and it begins to be realized

here with a large amount of information  
this is a very, well, quite effective system  
related to the fact that you well how can you work  
due to speed  
without highlighting the volume itself

as an example I would like to give here  
protocol 384 page is volume 2

and here was the task  
distinguish by degree of migration  
there in the range from  $10^{-6}$  to  $10^6$  times per second  
there could have been migration, generally speaking

but i said that  $10^6$  per second is the order of migration  
and at the same time he could be anyone at all  
there from zero 0 there to for example 10-20  
i.e. there were no specific characteristics at all

and here is the identification in this case  
It is precisely the interval  $10^6$  that consists in the fact  
what if it starts like Well, that's a bend  
this level of the Macro level of number 4  
towards the main mass of the number

it turns out that right here I recorded the number 5  
example, a specific number is revealed  
i.e. you just see it

and in this case  
this is it for example there was a number 10 to the 6th power

i.e. here the action is quite simple  
but if we talk about the mass of information  
then we actually get  
a very large amount of information

and in connection with this, strictly speaking, it is necessary here of  
course  
consider  
that control through numbers  
first of all, it is still a management  
where you choose the control principle  
or it is a dynamic principle if the volumes are very large  
or these are static if you work with some  
Well as if they were private control systems

Well the next method is that  
what do you actually use  
principle well quite simple related to dynamics  
in this case, one's own body

and highlight the number related  
to the body reaction parameter  
to external information

i.e., having singled out the dynamic reaction there

for example arms and legs  
those. motion system yes number 4

and selecting, for example, the static parameter  
well **or** there is a fixing system  
for example number 5 is the body yes

if we consider the number 6  
body well so like the body together with the neck, for example , yes  
and consider that 6 is also a neck  
i.e. here as if creating two semantic meanings  
in one number  
you can see that parameter 7  
i.e. for example if you look at the head  
well, how can I indicate that this is the part  
correlates with the number 7

then you get the ability to control  
event structure  
due to the fact that you can do just that  
there depending on the purpose of the events  
to give the picture of events, as it were, comparable systems

i.e. translating the system well as if by analogy it could be  
all elements of the systems

i.e. you have some event  
and in this case you need to get control  
from the point of view of achieving your goal

then you take and divide into seven systems  
some event  
and correlate the specific number of this event  
with selected elements yes for example

in this case, the designation, generally speaking, is in fact  
you can change it, it's not important

For example , I highlighted 7 different possible systems there  
which collectively denote a person

and then the highlighted number 7 that you see in the event  
you should relate for example to management  
i.e. to see an optical beam, for example, coming from the head  
on this date 7

Well conditionally if there is a need to divide an event there  
there is a cure for the disease in 3 events  
then it is enough to select 3 elements

in principle, it is enough for you to allocate it often  
let's assume in this management

Well For example there you can simply select three fingers  
there is the index finger for example  
average

or there is an unnamed one  
designate with numbers  
and divide  
that first there is a diagnosis  
then there is treatment  
and the third element is healing

and just simply withdraw  
mentally connect each of the three fingers  
with a specific number and fix it

as soon as you fix it  
you actually get control over numbers only  
you don't have to control it anymore  
for example, just well, yours there for example a finger

but you get control  
to a greater extent in this case by processes  
related to future processes

because the body  
as a manifestation of elements of future development  
the body contains elements of its next implementation  
i.e. future development

and therefore, unlike a static system,  
when you interact with your body  
you can work to a greater extent  
with the space of the future

as an example here I want to give an example  
relating to such a moment  
that at one time I gave a forecast  
he was referring to such an interbank crisis  
there twenty, I think there was the third of August 95

and this is on page 411 of the second volume  
where in general I gave a forecast just somewhere around 19 days in  
advance  
it means that there will be such a crisis

so this is the principle of this control  
it consists of well in relation to this level of implementation, for example  
is that you just  
break up the control space  
on space 1 here in this place yes number 1  
we are located

then number 2 access space  
i.e. the time during which the event is realized  
i.e. just time in this case

and 3 is some kind of event  
which should have been given in the forecast plan

while you work only with your goal  
and you seem to be little interested in well actually the question  
what exists

i.e. you need to identify the goal of management  
what should be said in this case, for example, about  
Well to a specific person

then you mean just  
I can fix it there on the same fingers  
this system for example 1 2 3  
and the number 3  
number 3 which I for example fix  
it's like at the point where I fix it  
goes to a specific date

in this case, the date is simply perceived  
as the level of fixation of the number 3

and, in fact, the management itself in this case  
it turns out to be quite simple  
if I relate to the processes of the future  
i.e. the future is where the physical body of a person works, for example

from the point of view of the following method  
I want to show the method  
Well it 's actually like even simpler

is related to the fact that we are inside a number  
we highlight the Macrocontrol system

and at such a high speed  
that within this Macrocontrol  
in any case, your task is actually being accomplished

this is the principle  
that the allocation of the Macro level  
and simultaneously achieving this level  
this is an action related to a specific number

for example we take the number 1  
and we must in the inner area  
highlight this Macro level  
where it is necessarily performed  
due to the fact that the level is Infinite  
your event is sure to happen

i.e. you need to kind of enter this level  
i.e. mentally enter this number 1  
set a management goal  
necessarily within a rigidly fixed number

and do management due to that  
that you work this way  
what do you mean you allow events to develop  
within a seemingly limited system

still 1 is a specific form  
allow development in the Infinite Region

and then at the expense of Infinity  
you achieve your control in any case

so here is the creation of the Infinite Factor  
internal area of the number 1  
it's just a mental and very strong compression  
perceived as an external level of the number 1

i.e. you represent 1  
you start mentally squeezing very hard  
and the goal of management is inside  
It is clear to you that you need to give it the Infinite status  
in the development of information  
inside 1 of this number 1

and further by compressing this number  
Well as if you were squeezing out a unique event  
you squeeze a ready-made event out of a number

and if there are two events  
then it is better to work in groups of 2 there and so on.  
i.e. it's better to work well as if within the framework of that system  
which is designated precisely as a numerical system

and as well such an event  
Here for example I can look at the protocol on page 437  
there was a need for the key to materialize  
because the key to the hotel was lost

and here the principle is very simple  
need to make an event on key implementation  
i.e. it is clear what the event is  
work for example , i.e. there is only one action here  
number 1 is enough  
materialization of one key

that means also due to the tension of Consciousness

is done by an effort of will  
pressure on external circuit 1

can be represented as 1  
Well as if composed of tubes or cone-shaped figures yes  
start squeezing them

and in the place where you want  
Well in this case here for example the key appeared in that bag  
which was shaken out there and there was definitely no key there

i.e., actually, this is such a method  
where do you organize matter  
by level well For example there is primary

because if we consider what the organization of matter is  
then there is a superconcentration of information and some  
compression  
overcompression gives a material substrate

in this case, well, the same , well , the same technology was used

the next method is  
what do you mean you create Reality you create a number  
by integral reflection of numbers

those. take for example the number 1 or number 2  
as I already said in these systems  
Macromanagement and private task are united  
and that's why I don't say it on purpose

i.e. action with these numbers  
this is already at the same time a harmonious system of combination  
as Macro Management

as well as the solution of a particular problem

i.e. the further I translate it, as it were  
for example, there is already a seventh method  
then you should see here that it exists  
this is exactly the principle  
when the level of Macromanagement and the particular task  
it's just that number  
with whom you work

here in working with number series  
we need to find that situation if possible  
when is your spiritual development ?  
makes it possible to get exactly this Macro number  
at the level of for example Well as if micro-numbers of the micro-level of  
Perception, etc.

and in this method you show the control in this way  
what does it mean when you actually show it  
First it's management

i.e. when you make an implementation using this method  
you have to show it first  
in the structure of external Reality  
number  
with which you are going to do the management  
i.e., you can take, generally speaking, any number  
because you have a management goal  
define it there by any number  
there is better from 0 there for example up to 9

once you have determined  
you kind of show this number

in the structure of your Perception  
and this number begins to be realized  
from the point of view of well as if the growth of Reality

i.e. the next Reality begins  
modify the next form of Reality  
modify the number that you fix

so that the principle of modification is not like that as if out of control  
i.e. you need to admit that there will be a change in the number

so that the principle of modification is not uncontrolled  
you just make a kind of edging of the number in a circle  
i.e. for example there you set the number of controls there for example 9 yes  
Do you have a principle that there are exactly 9 parameters?  
must be taken into account  
or just 9 you just liked this number  
you took and made this number as a control number  
set a management goal that you need to manage  
and this is for example the number 9

that means around  
just around this number  
put a number series  
from 0 to 9  
and depending on the displacement  
Well like this peculiar arrow on the dial  
depending on the offset of the number 9  
you build binary systems

i.e. in this case here the control consists of  
that you are sort of tracking the movement of the number 9

and build for example there are 9 1 and so on.  
i.e. you should see two numbers appear

and so that again the method is not , like, too expanded or something  
and at the same time it means that there won't be  
Well some uncontrolled development systems yes  
within a number series  
you need to imagine some kind of cone  
and from this from the center of this cone - from the top for example  
for example, you can draw lines to each number  
and the number 9 would be placed on this top

and just simply do 9 or any number  
on each line

then you would take into account the entire spectrum of management  
and mentally just a connection of this number  
imparting dynamic properties  
connect with each number  
at least a touch  
gives a controlling effect

so as an example Well example  
I will give here an example of treatment  
and this related to that this is volume three page 705  
that the diagnosis was AIDS stage 4  
and the conversation was about what it means to be necessary  
Well, in this case, to cure stage 4 AIDS in absentia

i.e. this method is implemented in this case like this  
that the task of healing there for example the number 7 in this case  
is located at the top of this peculiar cone yes  
some threads going to each number that are between  
and this 7 according to the purpose of the tasks is carried out for  
each number

in this case, the greatest activity was caused by

line from 7 to 0  
and you just have to hold it as if with Consciousness  
zero 0 inside this inside the circle of a kind yes

i.e. well, numbers are located around the circle  
you just have to hold the number 0, i.e. so that it doesn't drop out  
from this spectrum  
healing occurs  
Well in this case it is just like that  
AIDS cure methodology

when exactly is the form of AIDS  
begins to be neutralized

so, well, nevertheless, it's all the same  
management of any level of event  
because as soon as you start moving  
from the top of the cone  
to the number  
some of the numbers are trying to get out of this circle  
your task is to hold on

if you for a number of reasons  
you can use other control systems  
but keep the number  
you get the control effect

the next control comes down to this  
what does it mean at the moment of control  
you use actually  
very well as if an even simpler principle  
so where is the principle  
that you are sort of folding numbers onto a plane  
and roll them lengthwise as if, as if, of an imagined plane  
and so that from 0 there to 9  
you put a series of spherical tracks

then that means

then Well for example, you can put three or four there  
for example the smallest track is 0 there is 1  
for example 2 3 second next there again 0 1 2 3 4 5 etc.

i.e. as if they made one, two or three tracks  
and all you do is just on these paths  
as if, well, as if, setting the task related to Macromanagement

and the problem statement must be in the form of a number  
which you see simultaneously on the control  
For example there is number 2 yes this is your control number  
You want  
do you know what if you imagine 2 vertical  
on this peculiar substrate  
you then get the control effect

and that means in the future you will just need to  
except this level of number 2  
as if in Perception  
select all remaining numbers

Well where you put a two in general  
that's all

i.e. homogeneity of the selected number  
on two levels, like these spheroidal ones  
Well horizontal level and plus vertical  
gives a controlling effect

from the point of view of the example  
in this case the example is that  
what well I can consider a case from the three-volume work  
"Management Practice Path of Salvation" page 748

here we are talking about healing  
from inoperable cancer of the pancreas  
with germination into the duodenum

there if we consider the application to this case  
then the application consists of  
that the goal of management is healing, it is quite clear  
for example, by designating it with the number 1  
i.e. here we must keep in mind that this is the meaning  
it could be basically anything  
i.e. I can designate the number 5 for example yes

is there freedom in this system ?  
is that you can assign  
generally speaking, any number and inform as you wish

Well for example there is 1 if I assign  
then I can stretch as many paths as needed around  
numeric from sequences of numbers  
and it is necessary to create continuously consecutive rows, namely

today I am showing exactly this technology  
where the rows are always consecutive  
if they are located, for example, exactly  
well, either horizontally or vertically

if horizontal defines the word  
then the series is exactly 0 1 2 3 i.e. it is a consecutive series

and the closure of the track is very clear, as it were  
on a mechanical level

so here it turns out that the situation is that

What Well For example there I take it vertically and put the number 1  
and 1 2 3 there 4 5 6 7 there I make the first track  
then 0 1 2 3 4 5 6 7 8 9 yes  
i.e. in principle it's just that  
Here like a set of numbers , 0, 1 , etc.

and I think that the situation here is like this  
if we see that well let's say I want to get the number 1 like this  
so that it would be a result  
i.e. so that in this case the cancer there would be cured

then here you just need to do it  
in Perception  
how to highlight it turns out that highlight the number 1  
here is the one in the bottom row  
and vertical number

the whole external system is a system in reality  
just control stability

and in this case I think that the principle is like management  
should be such that you highlight this number  
in order to achieve control  
from the point of view of sustainability  
and from the point of view of what you are appointing  
in fact, any system as a control  
and you can relate it, for example, to management

i.e. in this case here is what I told  
Well as if about the main methods that concern  
still a fundamental principle of management  
it is the fundamental principle of number organization

so from this point of view  
Here For example Well at the level of lecture material, perhaps

or at the level of questions and answers which we will now discuss  
in the next part yes

we can generally speak at the level  
where, for example, I don't show it or what  
namely the fundamental systems of organization  
where is the concept of "sustainability"  
or is there a concept of "common" there ? management plan"

or you can just show it  
how does number work  
precisely in logical circuits

i.e. in this case you can work  
in principle only on the logical diagram

for example, if there is a number series  
then you can use a number series  
and just do the management  
due to the movement of this series or system of numbers  
but at the same time, well, the fundamental meaning is like  
it fits into a logical scheme and is not explained

this is what I just imagined  
in this part of the lecture  
this is still an explanation given here  
namely the method and principle of organizing the number

and well in relation there  
to some practical controls

so here if possible  
Well I'm like when we'll sort it out already  
a purely practical phase of questions and answers, perhaps?  
if possible, when I will answer exactly

Well for example, what number series can be applied  
what technology to use to organize the number

here we need to understand that it is precisely knowledge  
or what? principle of fundamental organization  
Well fundamental level of organization of number  
This is the principle that allows after all  
do management well as if more comprehensively

I tried my best in this lecture material  
to cover , as it were, a comprehensive fundamental plan  
where part of the control system is associated with the number as  
such  
in general with the organization in the system of Perception  
intersecting  
they are creating a complete system after all  
which denotes, as it were, that number  
which is being organized right now

i.e. I showed in this case the principle that says that  
that it is in your power to organize that number there  
which you want  
and it will be the manager

i.e. here is the subtext, well, the true subtext of this part of the lecture  
in that I created a kind of dynamic system  
Well, from the very beginning of the organization of numbers

and that's why it turned out that  
then well it is actually the most simple and manageable  
when we move on to specific tasks

but knowing this aspect allows  
Well, basically, to do management

from the point of view of precisely fundamental aspects  
but at the same time, generally speaking, you can take it  
only finite systems  
only work on the number  
without showing the fundamental part

so I'm ending this part of the lecture  
when working already methodologically for example yes  
when it comes to presenting the material  
precisely in methodological manuals  
will be presented first  
the very specific verbal part of the method means

and perhaps sometimes only general characteristics  
related to for example Well practice for example which was implemented

because sometimes you can if necessary  
there to give a fully realized practice, as it were  
but the point here is that the next control should be like this  
so that the implemented practice is not just a structure  
as if basically one factor in the implementation of this technology

because it is important to show here  
universalism

so when the methodology will be, for example, well or what? discharged  
in the form of lectures, so to speak  
then in the lecture part it is necessary of course to a greater extent  
highlight  
namely, the more factual part demonstrated

i.e. a large factual part  
for example, reliance on factual information in that part  
in which it follows can only be in some common places  
or sometimes if the full protocol then the full one

sometimes in the general part  
those. depending on example situations  
we will have to vary what to show

Well This is where I end this part  
after all, she is such that we need to put her to bed in the future  
somewhere around 35 minutes  
but considering that you are getting exactly that course  
which is fundamental  
then here I still gave it  
fundamental principles of number organization  
i.e. it's not exactly like that as if a course for such  
in this case, is it direct transmission ?

but nevertheless, in the second part we will try to do it this way  
that part that will be written out  
Well in this case as a methodological part  
and the part that we will look at in the second part  
when discussing issues and specific actions

where I will also give specific methods  
which can be either methodological systems  
tied as if to the development of the situation yes  
which means that in total there will be a number of methods and systems  
which will be the most as if Well or something simple and accessible

and only these parts will be taken from these systems  
which will be calculated for 35 minutes , for example  
lecture material

i.e. this is exactly what needs to be taken into account  
that the lecture part will still be about 35 minutes  
taking into account 10 minutes of questions and answers afterwards  
and the second part is purely practical

in accordance with this, taking into account that you will still have  
a certain kind of fundamental education  
you will be able to convey this part knowing the previous one

and then you will get that the transmission level  
it will be much more intense  
than just transferring there, well, nominally, control systems

and in order to ensure speed  
you must first understand it yourself  
this fundamental system as everyone in their own way  
then we can discuss it and get it  
some universal and some frameworks  
in understanding if we want  
you don't have to do this

so, but when will it be presented as if to the listeners  
after all, specific numerical series  
you must insist on that platform  
what do you know well as if it were the fundamental meaning

hence  
you actually know the whole control system  
in relation to the material presented

and that's why there is fundamentalism in education  
Well in this case yours from this position  
means that you are well imagining some action yes  
Well conditionally if a person does something like this  
Well some kind of material transfer management  
even to give education there for example at school  
anyway, you need to know some higher education program there

So try to proceed from these aspects  
that this is what is needed for this  
maybe not necessary

i.e. in the task of transmitting information  
this knowledge exists well precisely according to generalized systems  
somewhere in very specific actions

Well algorithms of specific actions can sometimes be  
they exist so that you can control the situation  
as if with more information or less  
and that's all

and as soon as you start doing management  
what next ? as if the degree of distribution of those already  
who will receive information next  
they can continue to use it in principle  
only by ourselves, strictly speaking  
here are the nominal numerical series

this is precisely the principle of first control  
it must be based on understanding and knowledge  
it means it is the fundamental part of management

so here I end, let's say, this  
after all, it turned out to be a generalized lecture

however, it means specific methods  
which we will take from here  
plus specific methods  
which will be discussed  
they will be the main ones in the main lecture  
which will already be presented for study

who of the listeners will want to know  
Well as if such a representative system

I have shown only one of the number organization systems

the system where the number can be organized  
spiritual impulse immediately  
and without affecting the rigid fixed control systems

i.e. I thought it was better to do this  
so that you know what methods there are  
when organizing the number  
than to give harsh forms from the very beginning

and in the future the task is still the same  
that the listener should still know the specific system

Well All

I am ending the first part of the lecture here  
and in the second let it be like work with practice  
so I will again give specific methods

and here is a selection of these methods  
will make up the first half of the lecture  
All  
then you will already be giving lectures
